

ANNEX III. Assignment Framework

For peer communication in the virtual environment, the training program uses the sharing of individual assignments and outputs through the forum. Participants will identify 5 edible species of wild mushrooms that are common in their regions, determine in which biomes they are located by means of the catalog which is another project output. These mushrooms will be collected at appropriate emerging times. For the participant's own safety, a new type of mushroom that is considered risky and traditionally unknown to the local population will not be used. After accessing the product, the participant will determine the most suitable method for the preservation of this mushroom and will share the results with other peers.
